Model AG 1016 Amplifier/Generator is a robust source of RF power for ultrasonic, laser modulation, RFI/EMI, plasma generation, general laboratory and industrial applications.

Featuring leading edge solid state design in all RF amplifier stages and a built-in DDS signal source, it provides everything for a complete and reliable, finely controlled RF power delivery system. It reflects the T&C ongoing commitment to provide RF power products of the highest quality, incorporating the current requirements for complete remote control and data acquisition features.

OPERATION

The AG 1016 produces up to 600W of RF Power over a frequency range from lower than 20 kHz to higher than 6 MHz, with low harmonic distortion. It operates without band switching or other adjustments. Extended range to over 6 MHz is possible with reduced output power or in AGC mode. Gain is rated at 57 dB with a typical gain flatness of ± 1.5 dB.

Front Panel offers a LCD display of Forward, Reflected and Load Power readings, RF Status, MGC/AGC setups and operating frequency in Generator Mode.

Power meters are calibrated into a 50 Ohm Load and are

accurate when unit operates into matched load. Outside of matched condition, the model AG 1016's power measurement system provides an accurate reading of VSWR. When used as amplifier, the AG 1016 is compatible with most signal and function generators, computer synthesizer cards and it accurately reproduces all waveforms within its output and bandwidth limits.

The Forced-air cooling system and the internal power supply are designed to permit operation over a wide range of temperature and global AC line conditions.

The AG 1016 is built to withstand a +5 dBm (1.1Vp-p) Input signal. The unit amplifies the inputs of AM, FM, SSB and pulse modulations with low harmonic distortion and output power stability.

OUTPUT PROTECTION

AG 1016 is protected by its internal monitoring system for greater than 600 Watts Forward Power, 80 Watts of Reflected Power and limits Output Power Amplifier current for High VSWRs below 50 Ohms. This is intended to protect the amplifier output stage from accidental overdrive at the input and an extreme mismatch at the Output.

GENERAL

T&C's products are designed to be reliable, compact and light in weight. The use of conservatively rated components ensures high reliability and eliminates the need for periodic retuning.
